

Old world craftsmanship for today's
residential and commercial applications.

PVC Clad Cupolas

PVC Clad cupolas give our customers the same design freedom as wood cupolas, but provide excellent longevity. PVC works like wood, paints better than wood and will last indefinitely. The cupola sub-structure is constructed of wood as usual. The outer layer is all PVC with no exposed wood. The PVC provides superb protection for the wood structure and will allow it to last indefinitely.

PVC Clad Cupolas are white when they arrive. They do not need to be painted. If white is not your color of choice, they can be painted different colors. Use a 100% Acrylic Latex Paint. For colors darker than 55% Light Reflective Value, use Sherwin Williams "Vinyl Safe®" Acrylic Latex Paint. It is recommended by Aztec® Brand PVC.

We build screen and storm doors with the same guiding force that we build all of our products with. We build you what you want. You can see from the small sampling of pictures below that we create one of a kind custom screen and storm doors.

We will use the wood of your choice. Our most popular wood is Western Red Cedar. However, Spanish Cedar, and African Mahogany come in close behind. You can have interchangeable glass/screen panels or a permanent screen and a removable glass panel. As you see, the one pair of screen doors has a "dragon fly" cut out. We just need a good idea of what you want the door to look like and we can take it from there.

TA Millwork has a long history of providing custom millwork starting years ago with handcrafted woodwork created by Tracy Algrim (TA). The hand-

crafted nature of our beginning lives on today in our new production facility. With capabilities ranging from high-speed milling machines to custom finishing capabilities. Located in central Kansas, customers across the United States can be served in a affordable and timely manner. In the event you do not find a product match with-in this website please contact us to discuss further custom product capabilities.

Our screen & storm doors are significantly more heavy duty than the typical door you would buy. There is no finger-jointed wood in our doors. Everything is solid wood . The stiles and rails are typically 3-1/2" in width. Our standard screen is Charcoal Aluminum. However we also have the "Invisible" Screen, Copper Screen, Stainless Steel Screen, and Pet Screen.

The doors on the lower left are all "True Divided Lite" Combination Screen/Storm Doors. We manufacture a large quantity of Screen/Storm Doors. Around 10% of them are the typical old style screen door. The rest of them all fall into the custom, "one of a kind" door. Our customer's like the "individualized" look and the feel that their door is unique to them.

The size of the door can vary as much as the style. We will make your door to a tolerance of 1/16" of an inch. Your door is truly made for you. It is not a larger stock door that has been cut down to fit your opening. In addition to screen doors, we make a large variety of screen panels for screened in porches. All you or your contractor has to do is to frame the openings, give us the sizes, and we will make the panels to fit your openings. They can be made to whatever style you like. Everything ships via common carrier. Uncrate it, finish it, and install it and you're ready to go. How easy is that?

We build screen and storm doors with the same guidingforce that we build all of our products with. We build you what you want. You can see from the small sampling of pictures below that we create one of a kind custom screen and storm doors. We will use the wood of your choice. Our most popular wood is Western Red Cedar. Ta Millwork has been producing wood moldings for a number of years. We produce both straight moldings and specialize in curved moldings. We have most of the specifications for both wood and synthetic windows. We can produce the pattern of your choice in both curved and straight pieces. If custom knives are required, we have our knives cut with a water jet CNC machine that exactly duplicates our DXF drawing file. So your casing will be exactly like the drawing file that you approve.

As a supplement to the wood molding line, we produce a "Flexible Extension Jamb" that can be very conveniently and economically used on the synthetic windows to extend their jambs so that they are flush with the inside of the sheetrock and can be conventionally trimmed with casing patterns. The above picture shows a "FEJ" (Flexible Extension Jamb" being applied to a casing. The jamb is aligned with the inside of the casing and nailed to the back of the casing. The casing will hold the correct arch in the FEJ. The casing is then applied to the wall and you're done. Quick, Simple, Easy, Cheap. What more could you ask for. Our stock veneer is Pine; however, we make our own veneers and a veneer can be made from any available specie of wood.

We have a basic line of cupolas. However, in addition to the basic cupolas, we provide a complete "Design / Build" service for most any size and shape of cupola. Our basic limitation is that it has to fit on a truck for shipping. Height is not to much of a restriction as we can break them down into segments. Width is more of a challenge. Eight foot across is our maximum. Any design within that size limitation is a workable project for us. We will design, draw, build, and ship the cupola to your project.
